

user of the product simply threads the invention-starting strip through the underside of the dispensing port located in the lid of dispensing container. The user then pulls the starting strip, being attached to the product through the port. As this first sheet of product pulls through the port it also brings through the port the second sheet of the product and dispenses the rest of the roll of product through the dispensing port as intended, continuing until the product container is empty.

This invention enables the users of such products the ability to quickly and easily begin use of the product without struggling to find the proper sheet and corner of the sheet to begin use of the product. The use of the invention in this manner will eliminate wasted sheets of the product used due to improper feeding through the dispensing port. Also for users and products that recommend avoidance of prolonged contact to the skin without gloves, this will expedite the amount of time required for the user to properly prepare the product for use.

## Claims

What I claim as my invention is:

1. The invention being either part of the product being dispensed or being made of another source materiel, such as a poly strip or any other semi rigid or rigid materiel, being bonded

by the previously mentioned means in the main body of the patent application to the proper corner of the center sheet in order to begin proper dispensing of the product being used. The invention being attached to the product, during the manufacturing process, before being put into a cored or coreless log dispenser, lies on top of the roll of product, and will not cause any changes to be made in the packaging of the products that it will enhance. Thus enabling the user of the product to easily thread the correct sheet from the center of the roll through the dispensing port in the lid and begin use of the product with proper dispensing until the product is used up.
